# Reliability & Versatile Application

# **SOLENOID VALVES** H030 SERIES

This dynamic series uses advanced technology to solve the issue of a lighter and more compact unit with larger flow rate, while at the same time reducing power consumption.

It also offers a variety of options, NPT 1/8 specification, and manifolds for up to 20 units, to provide expandability in response to advanced levels of requirements.

# A Full-Choice System in Response to High Performance and Versatility

From the standard specification with emphasis on space savings and cost performance, all the way to the high-spec units for FA use, this advanced solenoid valve series offers a wide range of configurations that build on a base of highly reliable basic functions to incorporate a rich variety of options, made to order products, and additional parts.

This powerful solenoid, while rated for low current levels (example: 36mA at starting for an AC100V unit), uses a varistor for AC and a flywheel diode for DC as the standard. A reliable surge suppression design.

Achieves a flow rate at this size of  $29 \,\ell$  /min [1.02ft.3/min.] (ANR)—at a supply pressure of 0.5MPa [73psi.]. Its ability to cover everything from single units and direct piping to multi-unit manifolds in flexibly expandable and rational configurations is one of its best features.

Plug connectors (optional) offer easy and reliable attaching and removing. Two types are available, straight and L, and both are equipped with LED indicators for easy confirmation of operations.

This solenoid valve includes a built-in interface unit for microcomputer and logic output signal enabling direct control of the solenoid valve. This made to order product is compatible with the FA era.

DIN connectors and 1000mm [39in.] or 3000mm [118in.] lead wires are also available as made to order equipment.

A non-locking type manual override for easy maintenance and adjustment is standard equipment. A locking protruding type manual override for fingertip operation (optional) is also available.

# Single Unit Valves Assembled Directly to T, F, and F01 Type Manifolds

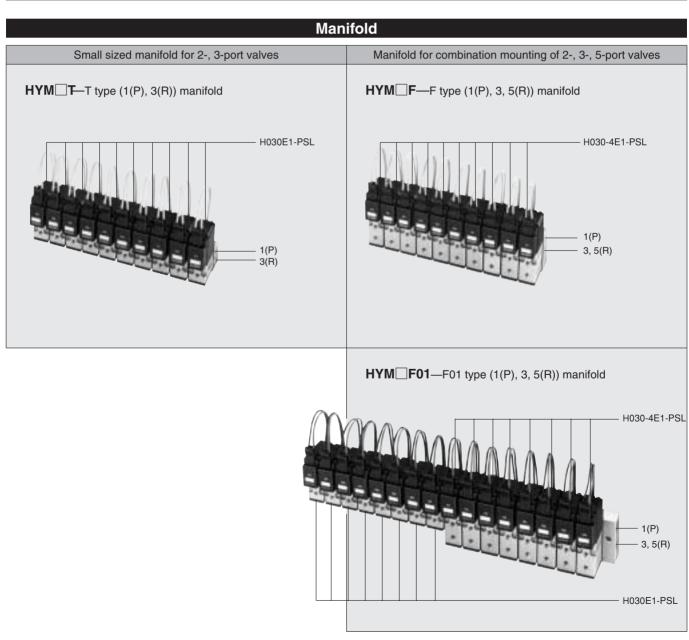

Mounting valves are identical to the single unit valves, and enable economical and immediate response to system upgrades and changes in numbers of units. For systems of up to 10 units with the 2-, 3-port, use the compact T type. For combination mounting with 2-, 3-, 5-port and up to 10 units, use the F type, and for 11 or more units, use the F01 type with connection ports of NPT1/8 specification, for a truly rational, detailed choice of systems.

A plug connector with a pre-wired common terminal is available as made to order, eliminating the need for tedious common terminal wiring even on multi-unit manifolds. The result is a neatly wired multi-unit, high density solenoid valve system.

# **Cylinder Operating Speed**

#### How to obtain cylinder speed

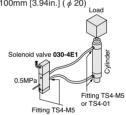

To obtain the time required for the cylinder to complete 1 stroke, add the cylinder's delay time t<sub>1</sub> (time between energizing of the solenoid valve and actual starting of the cylinder), to the cylinder's max. speed operating time t2.

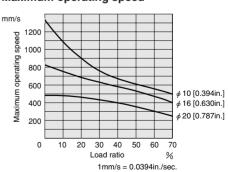

When a cushion is used, add the cushioning time t3, to the above calculations. The standard cushioning time t<sub>3</sub> is approximately 0.2 seconds.

#### Measurement conditions

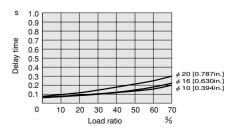

- Air pressure: 0.5MPa {5.1kgf/cm²} [73psi.]
- Piping inner diameter and length: φ 2.5 [0.1in.]×1000mm [39in.]
- Fitting:
  - Quick fitting TS4-M5 Valve side:
  - TS4-M5 (φ 10, φ 16) Cylinder side: TS4-01 ( ¢ 20)
- 100mm [3.94in.] ( φ 20)

## Maximum operating speed

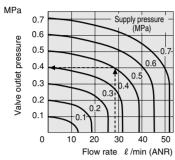

### **Delay time**

Note: Delay time changes depending on the valve construction, the volume of the cylinder and piping.

# **Flow Rate**

 $1MPa = 145psi., 1 \ell /min = 0.0353ft^3/min.$ 

#### How to read the graph

When the supply pressure is 0.5MPa [73psi.] and flow rate is  $29\,\ell$  /min [1.02ft.3/min.] (ANR), the valve outlet pressure becomes 0.4 MPa [58psi.].

# **Solenoid Valve Port Size**

#### **Made to Order**

The H030 series Solenoid Valves include a variety of made to order solenoids for application in a broader range of control and wiring types.

## Plug connector

Straight connector with LED indicator

Without lead wireConnector and contacts included

L connector with LED indicator

Without lead wireConnector and contacts included

•When ordering, enter -PSLN or -PSLL in place of the normal option code for the wiring type.

Lead wire length

● For lead wire length, -1L is 1000mm [39in.] and -3L is 3000mm [118in.].

When ordering, enter -1L or -3L following the wiring type option code.

#### **DIN** connector

A compact connector that is highly resistant to dust and water splashes.

Employs a self-stripping method that eliminates the need for de-sheathing the lead wire.

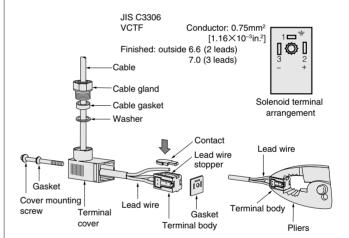

- When ordering, enter -39 in place of the normal option code for the wiring type.
- A varistor for surge suppression is also equipped. (For the AC100V and AC200V only. For the DC12V and DC24V, a flywheel diode for surge suppression is installed as standard equipment.)
- LED indicator is not available.

#### Wiring instructions

#### Solenoid with DIN connector

When de-sheathing (only the outer sheath of the cabtyre), pay attention to the lead wire direction. The cover will be easily mounted when the lead wire on the outer side of the terminal cover is set about 8mm longer than the inner side.

Without stripping off the sheath, insert the lead wire until it contacts the lead wire stopper on the terminal body, and then place the contact from the upper side. Then use pliers to press the lead wire further to ensure that the contacts are firmly touching the core wire.

The appropriate tightening torque for the cover mounting screw is 29.4N · cm {3kgf · cm} [2.6in · lbf].

#### **LED** indicator

The LED indicator for confirmation of operation is also available without a plug connector. This creates a clean monoblock look with a compact cover.

- When ordering, enter -L in place of the normal option code for the wiring type.
- A varistor for surge suppression is also equipped.
   (For the AC100V and AC200V only. For the DC12V and DC24V, a flywheel diode for surge suppression is installed as standard equipment.)

### **Handling Instructions and Precautions**

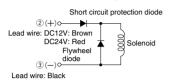

#### Solenoid

#### Internal circuit

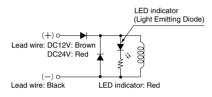

#### DC12V, DC24V

#### Standard solenoid (Surge suppression)

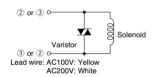

2 and 3 are for with DIN connector (order code: -39).

# Solenoid with LED indicator (Surge suppression) Order code: -PSL, -PLL

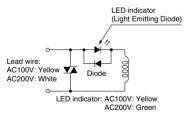

#### AC100V, AC200V

#### Standard solenoid (Surge suppression)

2 and 3 are for with DIN connector (order code: -39).

# Solenoid with LED indicator (Surge suppression) Order code: -PSL, -PLL

Cautions: 1. Do not apply megger between the lead wires.

- 2. The DC solenoid will not short circuit even if the wrong polarity is applied, but the valve will not operate.
- 3. Leakage current inside the circuit could result in failure of the solenoid valve to return, or in other erratic operation. Always use it within the range of the allowable leakage current. If circuit conditions, etc. cause the leakage current to exceed the allowable leakage current, consult us.

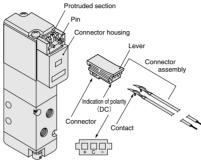

## Plug connector

#### Attaching and removing plug connector

Use fingers to insert the connector into the pin, push it in until the lever claw latches onto the protruded section of the connector housing, and complete the connection.

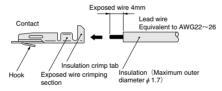

To remove the connector, squeeze the lever along with the connector, lift the lever claw up from the protruded section of the connector housing, and pull it out.

※Illustration shows the 110 series.

#### Crimping of connecting lead wire and contact

To crimp lead wires into contacts, strip off 4mm [0.16in.] of the insulation from the end of the lead wire, insert it into the contact, and crimp it. Be sure at this time to avoid catching the insulation on the exposed wire crimping section.

Cautions: 1. Do not pull hard on the lead wire.

2. Always use a dedicated tool for crimping of connecting lead wire and contact.

Contact: Model 702062-2M

Manufactured by Sumiko Tech, Inc.

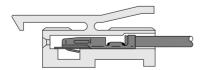

Crimping tool: Model F1-702062

Manufactured by Sumiko Tech, Inc.

## Attaching and removing contact and connector

Insert the contact with a lead wire into a plug connector  $\square$  hole until the contact hook latches on and is secured to the plug connector. Confirm that the lead wire cannot be easily pulled out.

To remove it, insert a tool with a fine tip (such as a small screwdriver) into the rectangular hole on the side of the plug connector to push up on the hook, and then pull out the lead wire.

Cautions: 1. Do not pull hard on the lead wire. It could result in defective contacts, breaking wires, etc.

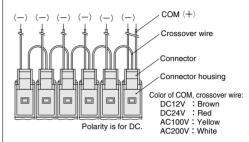

2. If the pin is bent, use a small screwdriver, etc. to gently straighten out the pin, and then complete the connection to the plug connector.

# Common terminal pre-wired plug connector

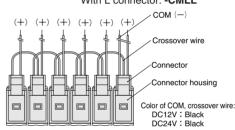

1. Pre-wired common terminal at DC positive side or AC.

Order code With straight connector: -CPSL With L connector: -CPLL

2. Pre-wired common terminal at DC negative side

Order code With straight connector: -CMSL With L connector: -CMLL

**Cautions: 1.** The diagrams show the straight connector configuration.

While the connector's orientation is different in the case of the L connector, in every case the first COM lead wire comes from the last station's mounted valve.

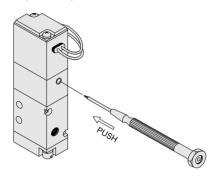

Since the COM terminal is connected to a crossover terminal inside the connector housing, the connector cannot be switched between a positive common and a negative common by changing the connectors.

#### Manual override

#### Non-locking type

To operate the manual override, press it all the way down. The valve works the same as when in the energized state as long as the manual override is pushed down, and returns to the rest position upon release.

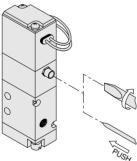

※Illustration shows the 110 series.

#### Locking protruding type

Use a small screwdriver to turn the adjusting knob several times in the clockwise direction, and lock the manual override in place.

When locked, turning the adjusting knob several times in the counterclockwise direction releases a spring on the manual override, returns it to the original position, and releases the lock.

For the locking protruding type, when the adjusting knob is not turned, this type acts just like the non-locking type, the valve is energized as long as the manual override is pushed down, and it returns to the rest position upon release.

※ Illustration shows the 110 series.

Cautions: 1. In the pilot type solenoid valve, the manual override cannot switch the main valve without air supplied from the 1(P) port.

- 2. Always release the lock of the locking protruding type manual overrides before commencing normal operation.
- 3. Do not attempt to operate the manual override with a pin or other object having an extremely fine tip. It could damage the manual override button.
- Do not turn the adjusting knob more than needed. It could result in defective operation.

# Mounting base 030-21

When installing a mounting base to the valve, always use the provided screws. The recommended tightening torque for the screws is 49N • cm {5kgf • cm} [4.3in • lbf].

#### Mounting valves on manifold

When mounting valves on manifold, apply the recommended tightening torque of 39.2N·cm {4kgf·cm} [3.5in·lbf] for the valve mounting screws.
