

## piINLINE®plus

### The piINLINE®plus is an inline vacuum generator optimized for the automotive industry. Why?

- The first inline vacuum generator with an alternative to use atmospheric air as an option to release products for saving compressed air
- 25% more energy efficient compared to the competition due to using the most energy efficient way to generate vacuum - the patented COAX® technology
- Efficient use of the compressed air to release the products (AQR)
- Short installation time thanks to the push in connection
- Provides one of the absolutely best solutions when looking for low weight end of arm tooling thanks to its super light weight
- Global fit thanks to its availability in both metric and imperial connections
- High reliability with improved uptime as the release function is based on a durable dust-proof membrane
- Extremely long lifetime as it can be disassembled and cleaned instead of buying a replacement
- Outstanding performance in the entire feed pressure range of 4.5-6 bar [65-87 psi]

# piINLINE®plus

- Ultra-lightweight decentralized ejector family with integrated release function ( Exhaust Block principle (EBR) or with Atmospheric Quick Release (AQR)), suitable for pick and place applications such as press to press transfer in automotive.
- Efficient and patented COAX® ejector with lower air consumption and faster response as compared to corresponding competitive products.
- Ejector with new STX nozzle gives extra fast response and a faster EBR (release) function. Also recommended in very dirty/dusty environments.
- Compressed air and vacuum ports inline.
- Easy to install directly on the vacuum hose, close to suction cup.
- Configurable product with several options for different push-in diameters, metric and imperial.
- Option to include a suction cup holder, ball mount or lock-pin style, found in automotive gripper tooling.
- Vacuum Sensing port available as option in configurator.
